"A component of the 26s proteasome binds on orphan member of the nuclear hormone receptor superfamily.";
J. Steroid Biocham. Mol. Biol. 56:23-30(1996).
-I- FUNCTION: THE 26S PROTEASE IS INVOLVED IN THE RAIP-DEPENDENT DEGRADATION OF UBIQUITINATED PROTEINS. THE REGLATORY (OR ATPASE) COMPLEX COMPERS ATP DEPENDENCY AND SUBSTRATE SPECIFICITY TO THE 26S COMPLEX. INTERACTS WITH THE ORPHAN NUCLEAR HORMONE RECEPTOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mus musculus (Mouse).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ó
                     The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and
             peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   or artigonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA express. The present sequence represents a specifically claimed example of (Ia).
generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The peptide epitope W77119-W77138 were created for human tumour-specific cytotoxic T lymphocyte response. These peptides are are cysteinedepleted mutants of a native disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific firmunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disease specific immunogen - comprises disease specific cytotoxic \tau lymphocyte epitope used to elicit melanoma specific CTL response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; human leukocyte antiqen; HLA; tumour associated antiqen; cancer; antigen presenting cell; APC; immunogenic peptide; immune disorder; viral infection; AIDS; hepatitis; bacterial infection; malaria; CEA; fungal infection; tuberculosis; melanoma; carcinoembryonic antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               peptides W39430-W39734 are used in a novel method for the selection of immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukcoyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral fammune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC class I allele HLA-A21.
                                                                                                                                                                                                                                                                              T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatablilty complex; MHC; B cell; disease; anti-tumour; anti-viral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Method of selecting T cell peptide epitope(s) - by measuring the stability of HLA class I-peptide complexes on intact B cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Van Der Burg SH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

having a human major histocompatibility complex (MHC) Class I (also having a human major histocompatibility complex (MHC) Class I (also known as human leukcoyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CPC) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and care particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunosehic peptides are also useful
                                                                                                                                                                                                                                                                                                                        immunogenic peptides with HLA binding motif, useful in treatment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences shown in W70044 to W70052 represent peptides derived from carcinoembryonic antigen (CEA). The peptides can bind to a human leukcoyte antigen (HAA). HAA-A2.1 and are used to exemplify the method control for invention of producing antigen-specific cytotoxic T cells (CTLS) in vitro. The method comprises contacting immunogenic peptides from an control for the binds class I major histocompatibility complex (MHC) antigen that binds class I major histocompatibility complex (MHC) molecules with antigen presenting cells (APCS) pretreatment growth factors, and incubating the APCS with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen specific CTLS. A method for specifically killing target cells in a human patient is also previded which comprises contacting the cytocoxic T cells with APCS pretreated with pre-treatment growth factors, where the APCS comprise class I MHC molecules. The pretreated APCS are incubated with the cytotoxic growth factors, thereby producing activated CTLS where the APCS comprise class I MHC molecules. The pretreated CTLS where the activated composition can then be administered to the patient. The activated composition and then be administered to the patient. The activated composition be used for treating cancers, immune disorders, viral infections, and the contacted with funded infection, funded in the contacted composition malaria or

having a human major histocompatibility complex (MHC) Class I (also having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes the antigen from which the peptide is derived. Thyphocytes (CTLS) which destroy antigen bearing cells are response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighthing viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or landividuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The charactering as a mannical and a patient of the and an analysis of the contacting a mannical and a patient of the and an analysis of the charactering as a mannical and a patient of the and an analysis of the contacting a mannical and an analysis of the contacting a mannical and an analysis of the contacting and the immunogent of peptides are also useful
     immunogenic peptides with HLA binding motif, useful in treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Non-immunogenic; epitope; T-cell; immunogenicity; immune system; SK; immunoglobulin; therapeutic; streptokinase; vaccine; 708.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ÷
                                                                                                                                                                                                                                                                                                                               The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogenic peptide having a human leukocyte antigen binding motif #1166.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytocoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

                                                                                                  proteins. The method comprises determining at least part of the amino acid sequence of sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins. e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the protein sequence of vaccine 2 708 VI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .CEA fragments can be used in assays to determine the presence and ant. of CEA in samples which also may contain related antigens including its normal cross-reacting antigen or the 128~\rm kD antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Carcinoembryonic antigen fragments - used in assays to determine the presence and amt. of the antigen in samples also contg. related antigens.
                                                                                       The invention relates to a method for the production of non-immunogenic
                                                                                                                                                                                                                                                                                                                                                                                        Gaps
sequence of the protein to eliminate potential epitopes for T-cells of a given species

These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They used in the study, isolation and purification of molecules to which they expecifically bind and the imaging and treatment of cells exhibiting the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membranebound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies into longer membrane bound did not react with anti-PRIA3 antibodies in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they precipically bind and the imaging and treatment of cells exhibiting the

The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membranebound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRAM3 epitope. The PRAM3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRAM3 antibodies indicating that the PRAM3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRAM3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific FRAM3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the

These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the BB 3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies in no longer membrane bound did not react with anti-PRIA3 antibodies in the office of the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the
